### INVITATION

## Objective

The mining industry wants to make a contribution to sustainable development (SD), however, it is an industry that is fundamentally based on a finite resource. In the context of SD, the mining industry faces key water challenges during both operational and closure phases of the mines, ranging from supply to protection to reuse.

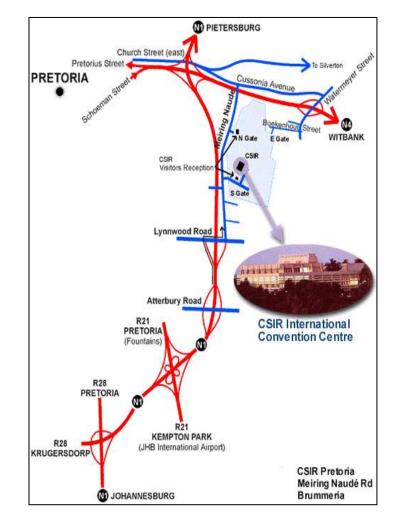

Developing countries/economies are debating nationalisation of mine resources which is not so much aimed at owning mines and mining companies, but rather at increasing the longer term benefit from the mineral resource. In particular, sustainability of the quality of life of communities around these mining operations is an area of acute interest.

We take pleasure in inviting you to a thought-leading symposium on the potential contribution that mine water can make to creating social value in the communities associated with mineral resource development. The aims of the symposium are to unpack the challenges associated with mine water during mine operation and closure (in the context of SD), to learn from current projects, and to

identify opportunities for mine water to create social value. The panel will consist of a range of stakeholders including civil society, mining and regulators, and will be facilitated to produce a position paper by the WISA Mine Water Division for further use.

If you have a stake, a role, or just an interest in mine water in this country, you need to be here!
