

Agility in Energy - Siemens at Africa Utility Week 2016

In view of the dramatically changing energy landscape, grid operators and utilities are faced with completely new technical and market challenges. Agility, the ability to approach business operations and resources in a highly flexible, responsive manner, increasingly becomes key to ensuring the reliability, efficiency, and sustainability of the power supply system as well as to a successful market position.

That's why we focus on supporting our customers in becoming agile and in benefiting from what automation and digitalization make possible: improved reliability and efficiency, outstanding consistency, and excellent response speed.

At Africa Utility Week 2016 we will be presenting exciting practical examples of how you can stay ahead of trends such as distributed energy systems, integration of renewable energy sources, changing customer behavior, and new forms of competition. A wide range of talks, presentations, demonstrations, and use cases will illustrate why agility is the basis for sustainable market success and how it can create new opportunities from the control room across the grid out to the meter or to the smart building.

We will provide you with first-hand impression of our innovative solutions based on our vast range of products, solutions, and services. Have you already wondered how you can become agile enough to master the energy challenge? Even the most challenging demands can be successfully met today with existing technology.

Visit us at the SAEEC South Africa pavilion, G8 No 220 during Africa Utility Week, 17 – 19 May 2016 and find out how Siemens can help you stay ahead of the challenge and ahead of the change.
